

Calculate Multiple Tables  
WordPerfect Magazine  
Q & A

Q: I use WP to create and monitor budgets for my company. In one document I may have up to 15 tables, each of which is often modified with new numbers. When I'm ready to print the document, it's tedious to edit and calculate the tables individually. Is there a way to calculate all the tables at once?

– W. Davis Burck, Houston, TX

A: WordPerfect doesn't have a feature to calculate all the tables at once, but the included CALCTBL.WPM macro should do the trick. Simply play the macro in your document with multiple tables, and voilà!
